

# MacTrix Orders 2011-12

- Please post, fax or email the ORDER FORM to BioResources or your consultant ASAP.
- This will help in planning our production. We anticipate increased demand on last year and we are aiming to supply this increase.
- However, those with advance orders will have preference if supply is short.
- Orders may be modified closer to the time of despatch.
- Use the tables below to help complete your ORDER FORM
- If adopting a 6 or 8 week program, start releases about 3 weeks before your main MNB pressure period.
- If adopting a 10 or 12 week program start releases about 6 weeks before your main MNB pressure period in order to catch 2 generations of moths.
- It is recommended that 1,000 wasps be released per hectare per week. Larger properties can reduce this rate considerably if they are able to identify hot spots for early treatment.
- Initially all the cards should be placed in the hot spots and boundaries.
- When nutborer eggs start showing up, spread the cards over a wider area.
- For example: If a block is 10 ha. Order 10,000 per week but initially release these over about 2 hectares of pressure boundaries and hot spots. This will target the early and densest egg laying areas and will enable a quick build up and dispersal of wasps as the moths numbers increase.
